

RARE THREATENED ENDANGERED (RTE) SPECIES IN PAN PAC FORESTS
PLEASE RECORD ANY SIGHTINGS IN THE FAUNA APP

Kaka (*At Risk-Recovering*) are large parrots. They require large areas of forest to survive. Kaka use their strong beak as a 'third leg' to help climb trees and reach food.

Blue Ducks/Whio (*Threatened-Nationally Vulnerable*) reside in clean, fast flowing streams and are a sign of a healthy waterway. Whio are also found on the \$10 note.

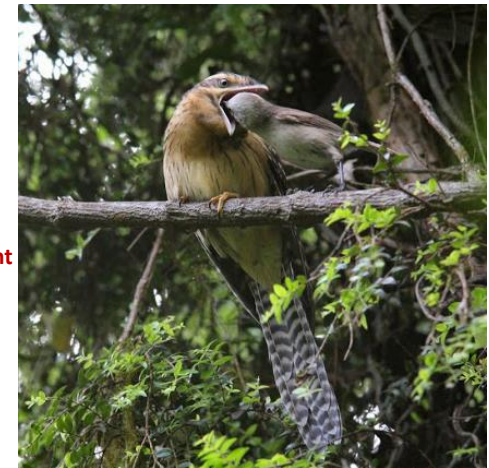

Long-tailed bats (*Threatened-Nationally Critical*) are nocturnal so are more likely to be seen in the evening or early morning when they leave their roosts to come out and feed. They have a very erratic flight pattern, similar to a swallow's.

Fernbirds (*At Risk-Declining*) inhabit wetlands and are rarely seen due to their secretive nature.

Brown Kiwis (*At Risk-Declining*) have been in our forests, but you are more likely to see probe holes in the ground since they are nocturnal. These holes are a similar shape and size to your finger.

Long-tailed cuckoo (*At Risk-Naturally Uncommon*) is a 'brood parasite' meaning it lays its eggs in other species nests.
